

Abstract – Government Document Tracker

The Government Document Tracking System is designed to simplify and digitalize the process of document submission, approval, and tracking in government offices through a secure web application. The system replaces traditional paper-based workflows with a centralized digital platform, reducing manual effort, processing delays, and errors while improving transparency and accountability in government services. It allows citizens to submit official documents online, track their status in real time, and receive updates regarding approval or rejection. Government officers can efficiently review, verify, and update document statuses, ensuring smooth inter-department coordination and faster service delivery.

Modules:

1. Administrator

- Manages the entire system
- Adds and manages departments and officers
- Monitors all document activities
- Approves or rejects critical requests
- Generates reports and system logs
- Ensures system security and access control

2. Citizen / users

- Register and log into the system
- Submits government documents online
- Uploads required files and details
- Tracks document status using tracking ID
- Receives notifications on updates
- Downloads approved documents

3. Officer / Employee

- Logs into assigned department portal
- Views submitted documents
- Verifies and processes applications
- Updates document status (Pending / Approved / Rejected)
- Adds remarks and feedback
- Forwards documents to higher authority if needed

4. Department Module

- Manages workflow between departments
- Assigns documents to officers
- Maintains document processing hierarchy
- Tracks inter-department movement of files
- Generates departmental reports

Main Functionalities

- User registration and secure login system
- Role-based authentication (Admin, Officer, Citizen)
- Online document submission system
- Unique tracking ID generation
- Real-time document status tracking
- File upload and secure storage
- Department-wise document workflow
- Notification system for updates
- Admin dashboard for monitoring all activities
- Search and filter document records
- Audit logs for transparency
- REST API integration for frontend-backend communication

The endpoints are commonly used in online voting management applications for handling authentication, election management, candidate records, voting operations, and result processing. These endpoints form the core communication layer of the Online Voting System for Colleges and contribute significantly to providing a secure, efficient, and transparent digital election platform.

API Endpoints Included

- POST /api/register/ – User registration
- POST /api/login/ – User authentication
- POST /api/documents/upload/ – Submit document
- GET /api/documents/ – Retrieve documents list
- GET /api/document/{id}/ – View document details
- GET /api/track/{tracking_id}/ – Track document status
- PUT /api/document/update/{id}/ – Update document status
- DELETE /api/document/{id}/ – Delete document
- GET /api/departments/ – List all departments
- GET /api/admin/dashboard/ – Admin dashboard data

Technologies Used

- Django
- React
- PostgreSQL
- HTML
- CSS
- JavaScript
- Bootstrap

The primary objective of this project is to develop an efficient, transparent, and scalable digital document management system for government offices. It demonstrates the real-world application of full-stack web development, secure authentication, REST API design, and database management

while improving public service delivery through technology.management, and secure software engineering principles in a real-world application environment within Software Engineering.
