

Abstract – Chit fund Tracker

The project is designed to simplify the process of managing chit fund operations by allowing administrators and members to manage payments, installments, auctions, and member records through a web application without manual paperwork. The system aims to automate the traditional chit fund management process, reducing time consumption and improving accuracy in financial transactions and member management. It helps administrators maintain member details, monthly payments, auction records, pending dues, and transaction history in an organized manner. The project also enhances user convenience by providing easy access to payment details, installment schedules, and auction information through the internet. Similar digital chit fund management systems are commonly used to automate financial transaction handling and member tracking.

Modules:

1. Administrator

- Manages the overall chit fund system
- Creates and manages chit fund groups
- Monitors member payments and auction details
- Maintains transaction records and system operations

2. Members / Users

- Register and log into the system
- Join available chit fund groups
- View installment and payment details
- Track auction and due payment status

3. Chitty Agents / Staff

- Manage member collections and payment records
- Handle auction updates and winner details
- Maintain transaction and installment history
- Generate reports and payment reminders

Main Functionalities

- User dashboard for registration and secure login
- Chitty group creation and management
- Monthly installment tracking
- Auction and bidding management
- Payment and due reminder notifications
- Transaction history management
- Admin dashboard for managing groups and members
- Staff dashboard for collection and payment management
- Responsive frontend interface
- REST API integration between frontend and backend
- Secure authentication

The endpoints are commonly used in financial and chit fund management applications for handling authentication, member management, payment tracking, and transaction operations. These endpoints form the core communication layer of the Chitty Tracker System and contribute significantly to providing a responsive, efficient, and user-friendly financial management platform.

API Endpoints Included

- POST /api/register/ – User registration
- POST /api/login/ – User authentication
- GET /api/chitty-groups/ – Retrieve available chitty groups
- GET /api/chitty-groups/{id}/ – View chit fund group details
- POST /api/payments/ – Add installment payment
- GET /api/payments/ – Retrieve payment history
- PUT /api/payments/{id}/ – Update payment details
- DELETE /api/payments/{id}/ – Cancel payment record
- GET /api/members/ – Retrieve member details
- POST /api/auctions/ – Manage auction details
- GET /api/admin/dashboard/ – Admin management dashboard

Technologies Used

- Django
- React
- PostgreSQL
- HTML
- CSS
- JavaScript
- Bootstrap
- Stripe

The project demonstrates the practical implementation of full-stack web development concepts, authentication systems, REST API integration, database management, and secure software engineering principles in a real-world application environment within Software Engineering.
